VORTEX FLOWMETER

DESCRIPTION

Vortex flowmeters operate based on the KARMAN principle. It provides an advantage to the user for massive and volumetric flow measuring of some fluids such as liquids, gases, and steam. With this product, measurements can be taken with an accuracy of 0.5% in liquid measurements and 1.0% in gas and steam measurements. For fewer error rates, high sensitivity of up to 0.2% can be achieved by precise calibration in our ISO 17025-certified calibration laboratories.

In the measurement logic based on the Von Karman Vortex path principle, the flow is divided into 2 by the effect of the object placed in the direction perpendicular to the flow and eddies rotating in the opposite direction are created. The frequency of these eddies, which propagate in waves, is measured.

Via the sensor in the vortex flowmeters (piezoelectric element) measures the speed by counting the frequencies, and the flow rate with the result of mathematical calculations. These measured frequencies are proportional to the amount of flow. Pressure and temperature data are used directly in mathematical calculations, especially since they directly affect the density in the mass flow measurement of gas fluids. For cases where these 2 values are variable, the compensated model is preferred and the changing density is also calculated to provide accurate flow measurement.

FEATURES

INPUT	12-32 VDC
SUBSTANCE	Liquid, gas, steam
ACCURACY	0.5% Liquid 1.0% Gas, 0.2% with optional calibration
MEASURING RANGE	0.3-7 m/sn liquid
	2-70 m/sn gas
CONNECTION	Flanged Connection
	Wafer Connection
INDICATOR	LCD Display
PRESSURE RANGE	4-100 Bar (Standard 6/10/16/25 Bar)
AMBIENT TEMPERATURE	-20°C +70°C LCD DISPLAY
	-40°C +85°C without display
MOISTURE RESISTANCE	%5-%95 Rh
OPERATING TEMPERATURE	-50°C +250°C
	-100°C +350°C High Temperature Model
OUTPUT	4-20mA ops. HART Display Model
	Model without Pulse Indicator
	Ops. RS485 Modbus
ADJUSTABLE SECTIONS	Flow mode, flow unit, scale, density, indicator data.
ALARM	Low Flow Alarm (3.8 mA), High Flow Alarm (22 mA}
CALIBRATION	2/5 point K-factor Correction
INDICATOR	1. Line Flow Rate
	2. Line Total Flow
	3. Line Flow, Current, Temperature, Pressure, Density %
COMPENSATION	Ops. Pressure Temperature Measurement and Compensation
	Recommended in Gas fluid with Variable Pressure and Temperature
TEMPERATURE PRESSURE CORRECTION	Correction with offset is available
FRICTION COEFFICIENT	Cd<24
EXPROOF PROTECTION	Ops. EXD Bt4

ADVANTAGES

- It is one of the most economical solutions for the measurement of high-pressure fluids.
- It provides high-precision measurement for saturated and superheated steam measurements.
- It is ideal for the economical measurement of gases such as natural gas, biogas, nitrogen, oxygen in continuous flow lines.
- It does not contain any moving parts and it has a long service life.
- The measuring sensor does not come into direct contact with the fluid, which extends the life of the measuring sensor.
- There is no need for physical maintenance other than contamination.
- Can be used horizontally or vertically.
- Its all-metal construction provides an advantage in terms of durability.
- It is protected against corrosion, if necessary, the metal material can be produced differently and used in corrosion fluids.
- It is not affected by vibration.

RIGHT PRODUCT SELECTION

CHOOSING THE RIGHT PRODUCT IS ONE OF THE MOST IMPORTANT ISSUES IN INDUSTRIAL APPLICATIONS.

THE CORRECT PRODUCT CHOICE CAN BE MADE IN THE LIGHT OF THE INFORMATION MENTIONED BELOW. 2/3 OF THE MISTAKES ARE DUE TO PRODUCT SELECTION AND INSTALLATION FAULTS THAT ARE NOT SUITABLE FOR THE PROCESS.

THE FOLLOWING IS THE BASIC INFORMATION THAT NEEDS TO BE OBTAINED AND CHECKED

- Fluid type and chemical properties
- Maximum, minimum and normal flow rate (or velocity information)
- Maximum and usage pressure
- Maximum and usage temperature
- Line Diameter

The minimum and maximum flow amounts should be suitable for the product measuring range to be selected. The right choice can be made by checking the product from the diameter/flow rate table.

The actual maximum pressure should be below the maximum compressive strength of the flowmeter.

The maximum and minimum temperature must match the temperature to withstand a range of the flowmeter.

After making sure that this information is correct, the availability of Vortex flowmeters is ensured and the selection is made according to the amount of flow. If the current line diameter and the selected flow meter line diameter are not the same, it should be adjusted with a reduction. In this case, the things to consider are;

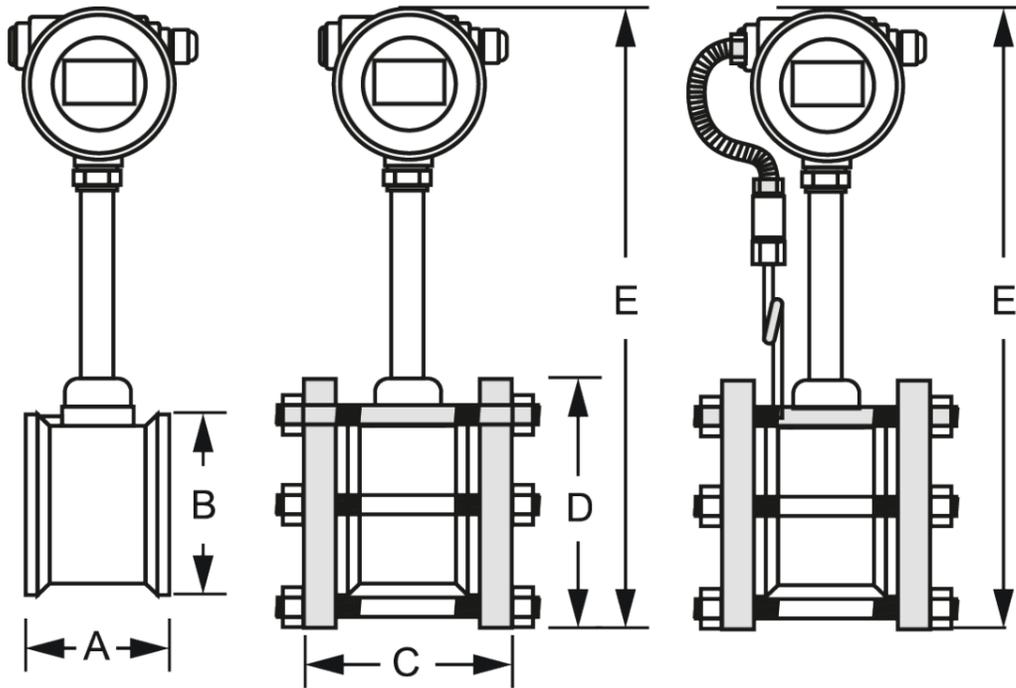

- It should be evaluated whether the application of the reduction causes a pressure change in the line and whether this change if any, will affect the current flow. In order to avoid this situation, it is not recommended to make large diameter changes in the reductions.
- When the reduction is preferred to reduce the cost of the flowmeter, it will not be the right choice if the cost of the reduction application is the same or more than the savings obtained in the selection of the flowmeter.

It should be ensured that the temperature, pressure and fluid information data to be given by the user are correct. Errors in this information may cause device failure or incorrect measurement. The assembly rules specified in the catalog and user manuals must be strictly followed. Flowmeter should not be installed on the line while welding, otherwise the electronics of the product may be damaged. The product should not be exposed to water hammer, even if it is flowing for the first time, it should be given gradually.

The product can even be mounted vertically and horizontally. In vertical mounting, the flow of liquid fluids should be from bottom to top. Considering that the compact models are IP67, they should be protected from external factors. Necessary precautions should be taken as exposure to direct sunlight will damage the product screen in all models. Users are strongly recommended to review the product manual thoroughly.
